

Abstract

Method for producing a fibrous web exclusively from cellulose fibers of natural origin, comprising the following procedural steps:

- 10        -        forming an essentially uniformly thick, dry fiber layer from loose fibers having a low moisture content,
- pressing and embossing the fiber layer to obtain a fibrous web and forming an embossed pattern,
- moistening the fibrous web with a water-latex mixture having a high water
- 15        concentration (75 to 99% by weight of water) and precipitating the latex in a drying process while the fibers are bonded inside and outside the fiber bond zones.
